

Thank you, Missah!

Welcome to this lesson where we talk about the recommendations made by an eminent panel of members on transport and triage.

Basis for EBGs in Transportation

- Which field triage criteria?
- When take online medical direction?
- When to choose air transport?

2

The panel has come up with a set of recommendations based on three questions and concerns, and they are:

1. Which field triage criteria should be used to risk-stratify injury severity and guide decisions as to destination and ground versus air transport modality?
2. When should online medical direction be obtained for assignment to the ground versus air transport to improve patient outcomes?
3. What are the criteria that would necessitate the assignment to air transport to improve patient

outcomes?

A set of recommendations were formulated based on these questions.

The recommendations for air transport by the expert panel are:

- The field triage criteria must include situational, anatomic, and physiologic components
- Consult with the Online Medical Direction or OLMD before activating HEMS for trauma patients
- HEMS is a better option than GEMS

With this, we come to the end of this lesson, and next, Missah will take you through the chapter review.
